The proposal (max 2 x A4 pages)

The clinical question – hypothesis: Can intensive rehab prolong the functional ability of patients with primary brain cancer.

The study background: Evidence to support the use of intensive rehab for patients who have sustained a CVA - Neuroplasticity

The rationale for the new research: Evidence will justify referring patients to community rehab schemes upon their discharge from the acute setting

A basic study plan: Quantitative research with a control group of patients who receive standard rehab and a study group of patients with the same diagnosis, stage of disease and similar age. Prospective study using outcome measures of functional, cognitive and perceptual assessments to determine the patients overall ability.
